

Rakiq

Product Requirements Document

Version 1.0 | MVP

Rakiq is a mobile-first web application for rating and documenting rakija (fruit brandy), inspired by Untappd. The focus is on the moment of tasting — at a bar, at a friend's place, at an event — without needing a barcode or a full bottle at hand.

1. Vision & Positioning

Problem

There is no dedicated application for rakija. Untappd is designed around beer and barcode scanning — it does not work in a bar context where you order a glass, not a full bottle.

Solution

Rakiq lets users find and rate any rakija by searching for name, producer, or type — no barcode required. The app works equally well for commercially produced rakija in bars and for homemade rakija in a personal diary.

Target audience

- Enthusiast — documents systematically, fills in all parameters
- Casual bar visitor — gives a quick rating in 3 seconds
- Home distiller fans — keeps a personal tasting diary

Competitive differentiation

Competitor	Difference	
Untappd	Built for beer and barcodes	Does not work with a glass in hand
Vivino	Wine only	No rakija social layer
Notepad	No social layer	No rakija database or stats

2. Data Model

Three types of rakija

Type	Description
Commercial (public)	Verified database of official producers. Only admins add/edit. Includes: producer, type, region, alcohol content, etc.
Personal entry	Unpopular commercial or regional rakija added by a user. Visible only to the creator and friends to whom the user has shared the list.
Homemade rakija	Fully personal list. No restrictions, no moderation. Visible only to the creator and shared friends.

Growth pipeline for the public database

If 5 or more users add an identical personal entry, the system automatically generates a suggestion to the admin for verification and inclusion in the public database.

Rakija record schema

Field	Type / Description
name	String — official product name
producer	String — producer / distillery
type	Enum — plum, grape, apricot, pear, fig, mixed, other
region	String — region of production
alcohol_pct	Float — alcohol percentage
is_public	Boolean — public or personal entry
created_by	UUID — user reference (for personal entries)

3. Rating System

Parameters

Parameter	Detail
Overall score	1–10 points. Mandatory. The only required field.
Aroma	Tags + optional free-text note. Optional.
Taste / palate	Tags + optional free-text note. Optional.
Finish (aftertaste)	Tags + optional free-text note. Optional.
Color / clarity	Tags. Optional.
Value for money	1–10 points. Optional.

Predefined tags

Category	Tags
Aroma	fruity, plum, apricot, oaky, floral, spirity, earthy, honey, vanilla
Taste	sweet, dry, smooth, sharp, balanced, buttery, spicy, bitter
Finish	short, long, warm, bitter, smooth, spicy, dry
Color	clear, golden, amber, cloudy, dark

Rating context

- Date — set automatically
- Venue / place — via GPS (Google Places API) or free-text fallback
- Photo — optional (v1.1)
- Note — free text, optional

4. Visibility Model

Rakija type	Visible to	Affects rating
Commercial (public)	All users	Global rating
Personal entry	Creator + selected friends	Personal / friends only
Homemade	Creator + selected friends	Never public

5. Social Layer

Activity Feed

Facebook-style feed showing all friend activity in reverse chronological order. Each card contains: avatar, name, rakija name, overall score, tags, and reactions.

Reactions

- Nazdrave (Cheers) — equivalent of a like, preserves product identity
- Comment — v1.1

Friend network

- Add friends by username or invite link
- Personal entries are shared manually with specific friends
- Homemade rakija entries are shared manually with specific friends

6. UX Flow — Adding a Rating

Step	Description
1. FAB button	Bottle icon (not a +) fixed at the bottom-right corner of the feed.
2. Bottom sheet	Opens a sheet with a search field. User searches by name, producer, or type.
3. Selection	If found in public database — select it. If not — option to 'Add personal entry'.
4. Quick rating	1–10 slider directly in the sheet. Mandatory field.
5. Quick save	'Save' button — rating is recorded with the overall score only.
6. Add details	Optional 'Add details' button opens a full page with tags, parameters, venue, and note.

Venue / location

- GPS active: system automatically suggests nearby venue from Google Places ('Bar Vodenitsata? Yes / No')
- GPS inactive or no result: free-text input field
- User never manually chooses between the two modes — the system decides

7. Design Identity

Concept

Warm, authentic, characterful. Brown palette with woody notes and a light vintage feel — without excessive ornamentation. Positioned between a craft artisan product and a modern mobile app.

Color palette

Role	Hex
Dark oak (primary text)	#3B2008
Walnut (secondary, buttons)	#7A5230
Accent (borders, highlights)	#C4956A
Light cream (tags, chips)	#EDD9C0
Background	#FAF3E8
Gold (rating, stars)	#D4A853
Green (verified badge)	#5C8A5C

Key UI details

- FAB button = bottle SVG icon, not a standard +
- Cream background (#FAF3E8) instead of white — warmer feel
- Typography: clean sans-serif, no decorative elements
- On button tap: subtle bottle-tilt animation (as if pouring)

8. MVP Scope

Database

In MVP	Public commercial rakija database, Producer + type + region, Personal entries
Later	Homemade rakija, Verification pipeline

Rating

In MVP	Overall score 1–10, Aroma/taste/finish tags, Free-text note, Auto date
v1.1	Color/clarity, Value for money, Finish parameter

UX flow

In MVP	Bottle FAB button, Bottom sheet search, Full-page details, GPS venue / free text
v1.1	Photo on rating

Social

In MVP	Activity feed, Nazdrave (like), Add friends
v1.1	Comments
Later	Share outside app, Push notifications

Profile

In MVP	List of rated rakijas, Rating count
v1.1	Favourite tags / statistics
Later	Badges / achievements

9. Tech Stack

Layer	Technology / Rationale
Frontend	Next.js 14 + React + Tailwind CSS. Well-known to Claude Code, excellent documentation.
Backend / API	Next.js API Routes. Everything in one project — no separate server needed for MVP.
Database	Supabase (PostgreSQL). Includes database + auth + realtime feed. Free tier up to ~50k requests
Authentication	Supabase Auth. Google OAuth + email/password. Included in Supabase at no extra cost.
Location	Google Places API. ~\$0 for small user base — generous free tier.
Hosting	Vercel. Free tier for Next.js projects. Pay only when real traffic arrives.
Mobile	PWA (Progressive Web App). Installs from the browser, works like a native app. No App Store ne

Estimated cost for MVP

Service	Cost
Vercel (hosting)	\$0 — free tier
Supabase (database + auth)	\$0 — free tier up to ~50k requests
Google Places API	~\$0 — generous free tier
Domain (e.g. rakiq.app)	~\$15 / year
Total	~\$15/year until the first ~500 active users

10. Next Steps

Phase 1 — MVP (with Claude Code)

- Create Next.js project with Tailwind CSS

- Configure Supabase — define database schema
- Seed initial public database with 50–100 commercial rakija entries
- Implement authentication (Supabase Auth)
- Build activity feed + add rating flow (bottom sheet + full page)
- Configure PWA manifest and service worker

Phase 2 — v1.1

- Homemade rakija personal diary
- Comments on feed entries
- Photo attachments on ratings
- Profile statistics and favourite tags
- Personal entry verification pipeline

Phase 3 — Growth

- Push notifications
- Map of venues with rated rakijas
- Producer partnership profiles
- React Native mobile application
